NetVault Backup サポートポリシー

The Quest Product Lifecycle and Support Services Guidelines detailing End-of-Support-Life (EOSL) procedures for all product lines are available online. The Product Life Cycle tables for NetVault Backup and NetVault SmartDisk are also available online.

Quest offers an Early Adopter (EA) Support level for NetVault Backup with applicable qualifications. For the supported combinations, see the various tables within this guide.

Early Adopter (EA) Support:

- Product is supported for early adoption.
- Quest recommends that the customer test the product in a nonproduction environment before production deployment.
- Full Support is planned for a future release.
- Support and Development provide limited support and assistance with deployment.
- Software updates and workarounds might not be provided.
- When the product is officially released, the customer must update to the general availability (GA) version of the given product.

Additional support definitions used throughout this guide might include:

- Limited Support (LS)
- Discontinued Support (DS)

Also, an individual manufacturer's End-of-Life (EOL) and EOSL product-support policy and statements supersede any support implied directly or indirectly by the information within this guide.

The naming convention used in this policy topic follows the standard product release versioning scheme of (Major.Minor.Maintenance.Patch). Quest provides full support of current (n) and prior (n-1) versions of NetVault Backup. These versions, n and n-1, are defined as major feature releases. After a major release becomes n-2, it enters LS for one year.

Host operating system(OS) and application version support policy

In addition to what is listed in this guide, Quest provides NetVault Backup support for host operating systems and applications where the following criteria have been met:

- Vendor OS or application maintenance or patch versions of the same major or minor release already supported are also supported, unless otherwise stated.
- Vendor OS or application major or minor versions that are newer than what is listed in this guide are not supported and require a separate qualification effort, unless otherwise stated.

Best reasonable effort(BRE) support

If a Support Request (SR) concerns a supported NetVault Backup product, application, or OS platform release combination per this guide, but the vendor no longer supports the application or OS, Quest only provides BRE support for issues that Quest determines pertain to that vendor's application or OS. In this scenario, the vendor is not expected to assist, and Quest recommends that you upgrade to a supported NetVault Backup and application or OS version combination.

Application plug-in EOSL policy

A NetVault Backup application plug-in's limited-support start date and EOSL date are the same as the latest major or minor NetVault Backup version it is supported with per this guide. Each fully supported version of NetVault Backup limits Full Support of a plug-in version to n and n-1 major plug-in releases as determined by n; in this case, n is the latest major plug-in version supported by that NetVault Backup major release. After a major plug-in release becomes n-2, it enters LS for one year. After the one year passes, the plug-in reaches EOSL and support is discontinued for that plug-in version.

Virtualized NetVault Backup Server and Client policy

NetVault Backup Server and Client components are supported when running in a virtual machine (VM) as long as NetVault Backup is running in a hypervisor guest OS that is officially supported by NetVault Backup. Supported hypervisor programs are: KVM, Hyper-V, Oracle VM server, Virtual Iron, VMware ESXi, and Xen.

Additional notes:

- Support considerations for NetVault Backup Server and SmartClients:
- Storage devices that are directly attached to an ESXi Server are not supported. Unsupported devices include both direct-attached SCSI devices and devices on Fibre Channel that are exposed to the VM through a raw-device mapping.
- Devices connected through iSCSI are supported.
- The VM that hosts the NetVault Backup Server must be assigned a sufficient resource reservation

- in its own Resource Pool. NetVault Backup Servers that have to compete for resources are not supported.
- VMware vSphere High Availability (HA) and vMotion are supported for the VM that hosts the NetVault Backup Server. However, due to variability in timings, Quest does not guarantee successful completion of backup jobs run during a migration.
 - NetVault SmartDisk does not support installation on a VM.
Quest NetVault Backup Compatibility Guide
NetVault Backup platform support 16
 - Quest may require reproduction of an issue in a non-virtualized environment in cases where it suspects an issue with the underlying virtualization infrastructure.
 - Using the Plug-in for FileSystem on the physical hypervisor server machine to perform image-level backups of the VM is not supported. Installing the Plug-in for Hyper-V or Plug-in for VMware on the physical machine to perform image-level backups of the VM is required.

プロセッサーの種類とビットモード

The following table explains the nomenclature used throughout this guide to represent various types of architecture. When the processor supports both 32- and 64-bit operating systems and applications but a specific bit mode is required, the bit mode is called out in parentheses; for example, x86-64 (64-bit).

Table 2. Processor types and bit modes

Compatibility with Quest Rapid Data Access (RDA) and EMC Data Domain Boost (DD Boost)

The RDA and DD Boost client-side data-deduplication plug-ins are supported with most application-oriented NetVault Backup Plug-ins and products. The exceptions include plug-ins that are based on the network datamanagement protocol (NDMP), such as:

- NetVault Bare Metal Recovery Plug-in Offline Client (Linux-based VaultOS)
- NetVault Bare Metal Recovery for NetVault Backup Server
- Plug-in for NDMP
- Plug-in for SnapMirror to Tape
- Plug-in for Snapshot Manager
- Plug-in for SnapVault Manager

Because encryption affects deduplication and storage, Quest also recommends that you do not use RDA or DD Boost with the Plug-in for Advanced Encryption or Plug-in for Standard Encryption.

The following operating systems are supported for RDA and DD Boost with NetVault Backup. For detailed information, see [Table 4](#).

- HP-UX 11.31 (IA-64) — RDA requires NetVault Backup 12.2 or later.
- Linux x86 (32/64); pure 64-bit
- Solaris Intel — RDA requires NetVault Backup 11.0 or later and Solaris 10 Update 10 or later; not supported with DD Boost.
- Solaris SPARC — RDA requires NetVault Backup 11.0 or later and Solaris 10 Update 10 or later.
- Windows x86 (32/64); pure 64-bit

For more information, see the applicable section in the Quest NetVault Backup Supported VTLs, Libraries, Tape and Optical Drives document available at <https://support.quest.com/technical-documents>.

NetVault Bare Metal Recovery – クロス プラグイン互換性

- [Cross-plug-in compatibility](#)

i **IMPORTANT:** For the Plug-in Server to function correctly, all its associated components must be the proper version (that is, version "X" of the Plug-in Server only works with its appropriate version of Plug-in Live Client and Plug-in Offline Client). The following table identifies which Plug-in Offline Client and Plug-in Live Client versions are compatible with which Plug-in Server versions.

Support for Plug-in Server and Plug-in Live Client or Plug-in Offline Client combinations of like versions are implied and not listed in this table.

Explanation of EOM Errors

If unexpected End of Media (EOM) issues are encountered while spanning media, add the **Test On Sync=FALSE** value to the **ndmpversions.cfg** file.

Example for ONStor Filers:
[ONStor-V4:Mover Server]
 Tape Postfix=h
 Allow nonNdmp Transfers=true
 Backup window = true
 Test On Sync=FALSE

NetVault Backup Plug-in for SnapMirror to Tape
