

What's New in erwin Data Intelligence by Quest 13

erwin Data Marketplace makes its debut in erwin Data Intelligence 13 along with added enhancements to speed asset discovery and data landscape understanding.

Introducing erwin Data Marketplace

erwin Data Intelligence 13 provides new data marketplace capabilities to ensure all data users – no matter their technical expertise – can easily shop for the trusted data needed to move your business forward. erwin Data Marketplace provides one central, consumer-friendly location to shop, share and compare enterprise data.

- Shop for available enterprise datasets and AI models within a consumer-like discovery experience. Use dynamic filtering, automated data value scoring, social ratings and reviews, and related data intelligence such as mind maps, data lineage and more to find and shortlist potential datasets for your needs.
- Easily compare multiple assets at once with a side-by-side view of key properties to make your final dataset or AI model selection
- Leverage automated data value scoring based on user-defined weighting of scoring criteria and visualize data value into gold, silver and bronze tiering for easy identification
- Share data knowledge and raise visibility of useful data through a star rating system and user reviews
- Use built-in task and chat capabilities to collaborate around data, ask questions and gain access to datasets and AI models
- Provide data stewards and owners all the governance-related capabilities needed in one location to curate data, manage access requests and always be audit-ready

Additional 13.0 Enhancements

- Speed asset discovery with keyword recommendations provided as you search for assets and the ability to save searches for future use
- Zero-in on data lineage detail quickly by filtering out objects onscreen to reduce the environments shown; using Switch View to view data lineage only across the environment, system, table or column level; or taking advantage of new dynamic search capabilities to go directly to an asset.
- Assign searchable enterprise tags to multiple assets at once to speed discovery, ready for analysis or reporting and lay the groundwork for automation
- Ingest metadata and data lineage from Databricks Unity Catalog into erwin Data Intelligence with an optional Smart Data Connector
- Leverage new RESTful APIs for bi-directional integration with other systems
- And more. View the erwin Data Intelligence 13.0 release notes for all enhancements and more detail on the [Quest Support Portal](https://quest.com/erwin/support).
